1 Weekly Summary

AI-Generated Content

The summary below was written by Claude (Anthropic) from that week's regression outputs and series descriptions. It has not been reviewed or fact-checked by a human, and should be read as an automated, informal recap – not analysis.

Welcome back to the weekly parade of economic series that have never met, never will, and yet are being forced into statistical matrimony for our amusement. This week's lineup includes Massachusetts goods-producers, nursing home prices, Missouri bank returns, Puerto Rican employment, boneless chicken breast, and a discontinued Norwegian recession indicator. If that reads like a grocery list assembled by throwing darts at a spreadsheet, that's because, functionally, it is. Standard disclaimer up top so nobody emails me: these pairings are random, I am making no causal claims, and spurious correlation isn't a bug here, it's the entire genre.

Monday kicked things off with Springfield goods-producing employment versus nursing home prices, and the raw regression came out swinging with an R-squared of 0.78 and a p-value with so many zeros you could get lost in them. "Aha," you think, "a relationship for the ages." Then we detrend, and the whole thing evaporates into a p-value of 0.52 and an R-squared of 0.02. Truly a masterpiece of the trend-mirage genre: two things that happened to drift together over three decades, pretending to be soulmates until we subtract time itself and they stop returning each other's calls. Tuesday's IT new orders versus Missouri bank equity returns did the honorable thing, though — weak in the raw (R-squared 0.14) and still squeaking in as significant after detrending, albeit with coefficients so small you'd need a microscope and a reason to live to interpret them. I'll take it as a modest, genuine-ish flicker.

Now for the plot twist nobody ordered. Wednesday paired residential electric power prices with restaurant and bar sales — classic shared-upward-drift material, raw R-squared of 0.74 — and it did soften when detrended, but it stubbornly stayed significant at a respectable R-squared of 0.21. Fine, maybe people pay more for both electricity and brunch over time, who's to say. But the real showstoppers were Thursday and Friday. Puerto Rican covered employment versus U.S. travel exports: barely significant in the raw (and not even at the fancy threshold), then detrending cranks it up to an R-squared of 0.52 and a p-value that fell off a cliff. That is the opposite of a mirage — the relationship got stronger once we stripped the trends out, which is the rarest and most suspicious-in-a-good-way outcome this project produces.

Friday's finale — a discontinued Norwegian recession indicator versus Northeast adjustable-rate mortgage margins — held up in both the raw and detrended versions, with the detrended R-squared actually climbing to 0.22 and a p-value boasting more zeros than a government bailout. Do I believe Norwegian recessions are secretly steering New England mortgage paperwork? Absolutely not, and you shouldn't either. But in a week where my headline act was two series that got divorced the instant we removed their shared timeline, I'll gladly tip my hat to the few pair-

ings that survived the detrending gauntlet. As always: it's random, it's silly, and if you draw real conclusions from it, that's on you, not the chicken breasts.

2 Date: 2026-11-02

Series ID: SMU25781000600000001
This series is titled All Employees: Goods Producing in Springfield, MA-CT (NECTA) and has a frequency of Monthly. The units are Thousands of Persons and the seasonal adjustment is Not Seasonally Adjusted.The observation start date is 1990-01-01 and the observation end date is 2024-12-01.The popularity of this series is 1.

Series ID: PRGONUPIHCSA
This series is titled Medical Services Expenditures by Provider: Nursing Homes: Proprietary and Government Nursing Homes Price Index and has a frequency of Annual. The units are Index 2017=100 and the seasonal adjustment is Not Seasonally Adjusted.The observation start date is 2000-01-01 and the observation end date is 2021-01-01.The popularity of this series is 1.

2.1 Raw Regression

Regresses the two series against each other directly. A significant result here can come just as easily from both series sharing a long-run trend as from any real relationship.

Dep. Variable:	value_fred_PRGONUPIHCSA	**R-squared:**	0.783
Model:	OLS	**Adj. R-squared:**	0.772
Method:	Least Squares	**F-statistic:**	72.01
Date:	Mon, 02 Nov 2026	**Prob (F-statistic):**	4.64e-08
Time:	21:06:51	**Log-Likelihood:**	-73.979
No. Observations:	22	**AIC:**	152.0

7.2 Detrended Regression

Regresses the residuals of each series after removing its own linear time trend, so a shared trend can no longer drive the result on its own. A relationship that stays significant here is better evidence of a genuine link between the two series.

Dep. Variable:	value_fred_MORTMRGN5NE_detrended	**R-squared:**	0.220
Model:	OLS	**Adj. R-squared:**	0.219
